

AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

Claims 1-15 are cancelled.

16. (new): A leak detector for detecting leakage of liquid stored in a tank based on fluctuation in a level of the liquid, the tank including a top plate, a bottom plate, and a side plate connecting the top plate and the bottom plate, the top plate includes a through opening, wherein

the leak detector is arranged inside the tank in such a manner that a first end of the leak detector is detachably attached to the bottom plate and a second end of the leak detector is supported in the through opening in such a manner that the leak detector is movable in a direction substantially perpendicular to a surface of the liquid.

17. (new): The leak detector according to claim 16, comprising:

a liquid inlet/outlet portion near the first end through which the liquid flows in and out of the leak detector;

a flow-rate measuring unit arranged near the liquid inlet/outlet portion inside the leak detector toward the second end, and configured to measure an amount of flow of the liquid occurring through the liquid inlet/outlet portion; and

a liquid retaining portion arranged between the second end and the flow-rate measuring unit, and including a space

configured to retain liquid that has flown therein through the liquid inlet/outlet portion.

18. (new): The leak detector according to claim 17, wherein the first end is detachably attached to the bottom plate with a magnet.

19. (new): The leak detector according to claim 16, wherein the second end is supported in the through opening using an elastic member.

20. (new): The leak detector according to claim 17, further comprising

a protective member configured to protect the flow-rate measuring unit and the liquid retaining portion from the liquid, and arranged outside the flow-rate measuring unit and the liquid retaining portion, wherein

the protective member is formed with a metal having such a thermal expansion coefficient that a distance between the flow-rate measuring unit and the bottom plate is maintained substantially invariant.

21. (new): The leak detector according to claim 20, wherein the protective member is formed with a material identical to a material of the tank.

22. (new): The leak detector according to claim 16, further comprising an intermediate member formed with a magnetic material, and arranged at the first end such that the leak

detector is attached to the bottom plate through the intermediate member.

23. (new): The leak detector according to claim 17, wherein
the flow-rate measuring unit includes

a flow path portion through which liquid flows between
the space and the liquid inlet/outlet portion;

at least one temperature detecting unit configured to
detect temperature of liquid inside the flow path;

a heating unit configured to heat the liquid inside the
flow path portion; and

a controlling unit configured to control heating
temperature of the heating unit for heating the liquid inside the
flow path portion so that the temperature of liquid inside the
liquid retaining portion and the temperature of the liquid inside
the flow path portion become substantially equal.

24. (new): A leak detector for detecting leakage of liquid stored
in a tank based on fluctuation in a level of the liquid, the leak
detector comprising:

a liquid retaining portion including a space configured to
retain liquid flown into the leak detector, the liquid flown
being a part of the liquid in the tank;

a flow path portion through which the space communicates
with an interior of the tank and through which the liquid flows
in and out;

a flow path opening/closing unit configured to open and
close at least one end of the flow path portion;

a flow-rate measuring unit configured to measure an amount
of the liquid flowing inside the flow path portion; and

a calibrating unit configured to calibrate the flow-rate measuring unit.

25. (new): The leak detector according to claim 24, wherein the flow-rate measuring unit includes

at least one temperature detecting unit configured to detect temperature of liquid inside the flow path portion;

a heating unit configured to heat the liquid inside the flow path portion; and

a controlling unit configured to control heating temperature of the heating unit for heating the liquid inside the flow path portion so that the temperature of liquid inside the liquid retaining portion and the temperature of the liquid inside the flow path portion become substantially equal.

26. (new): The leak detector according to claim 24, wherein

the calibrating unit calibrates the flow-rate measuring unit based on a signal corresponding to temperature of liquid being inside the flow path portion without flowing .

27. (new): The leak detector according to claim 24, wherein the flow-path opening/closing unit includes a solenoid valve.

28. (new): A leak detector for detecting leakage of liquid stored in a tank based on fluctuation in a level of the liquid, the tank including a top plate, a bottom plate, and a side plate connecting the top plate and the bottom plate, the top plate includes a through opening, the leak detector comprising:

a liquid retaining portion including a space configured to retain liquid flown into the leak detector, the liquid flown being a part of the liquid in the tank;

a flow path portion through which the space communicates with an interior of the tank and through which the liquid flows in and out;

a flow path opening/closing unit configured to open and close at least one end of the flow path portion;

a flow-rate measuring unit configured to measure an amount of the liquid flowing inside the flow path portion; and

a calibrating unit configured to calibrate the flow-rate measuring unit, wherein

the leak detector is arranged inside the tank in such a manner that a first end of the leak detector is detachably attached to the bottom plate and a second end of the leak detector is supported in the through opening in such a manner that the leak detector is movable in a direction substantially perpendicular to a surface of the liquid.

29. (new): The leak detector according to claim 28, wherein the first end is detachably attached to the bottom plate with a magnet.

30. (new): The leak detector according to claim 28, wherein the second end is supported in the through opening using an elastic member.

31. (new): The leak detector according to claim 28, wherein the flow-rate measuring unit includes

at least one temperature detecting unit configured to detect temperature of liquid inside the flow path portion;

a heating unit configured to heat the liquid inside the flow path portion; and

a controlling unit configured to control heating temperature of the heating unit for heating the liquid inside the flow path portion so that the temperature of liquid inside the liquid retaining portion and the temperature of the liquid inside the flow path portion become substantially equal.

32. (new): The leak detector according to claim 28, wherein the calibrating unit calibrates the flow-rate measuring unit based on a signal corresponding to temperature of liquid being inside the flow path portion without flowing.

33. (new): The leak detector according to claim 28, further comprising

a protective member configured to protect the flow-rate measuring unit and the liquid retaining portion from the liquid, and arranged outside the flow -rate measuring unit and the liquid retaining portion, wherein

the protective member is formed with a metal having such a thermal expansion coefficient that a distance between the flow-rate measuring unit and the bottom plate is maintained substantially invariant.

34. (new): The leak detector according to claim 33, wherein

the protective member is formed with a material identical to a material of the tank.

35. (new): The leak detector according to claim 28, wherein the flow-path opening/closing unit includes a solenoid valve.

36. (new): A leak detecting system for detecting leakage of liquid stored in a tank based on fluctuation in a level of the liquid, the tank including a top plate, a bottom plate, and a side plate connecting the top plate and the bottom plate, the top plate includes a through opening, the leak detecting system comprising:

a leak detector arranged inside the tank in such a manner that a first end of the leak detector is detachably attached to the bottom plate and a second end of the leak detector is supported in the through opening in such a manner that the leak detector is movable in a direction substantially perpendicular to a surface of the liquid; and

a controller configured to control the leak detector.

37. (new): The leak detecting system according to claim 36, wherein the leak detector includes

a liquid inlet/outlet portion near the first end through which the liquid flows in and out of the leak detector;

a flow-rate measuring unit arranged near the liquid inlet/outlet portion inside the leak detector toward the second end, and configured to measure an amount of flow of the liquid occurring through the liquid inlet/outlet portion; and

a liquid retaining portion arranged between the second end and the flow-rate measuring unit, and including a space configured to retain liquid that has flown therein through the liquid inlet/outlet portion.

38. (new): A leak detecting system for detecting leakage of liquid stored in a tank based on fluctuation in a level of the liquid, the leak detecting system comprising:

- a leak detector including

- a liquid retaining portion including a space configured to retain liquid flown into the leak detector, the liquid flown being a part of the liquid in the tank;

- a flow path portion through which the space communicates with an interior of the tank and through which the liquid flows in and out;

- a flow path opening/closing unit configured to open and close at least one end of the flow path portion;

- a flow-rate measuring unit configured to measure an amount of the liquid flowing inside the flow path portion; and

- a calibrating unit configured to calibrate the flow-rate measuring unit; and

- a controller configured to control the leak detector.

39. (new): A leak detecting system for detecting leakage of liquid stored in a tank based on fluctuation in a level of the liquid, the tank including a top plate, a bottom plate, and a side plate connecting the top plate and the bottom plate, the top plate includes a through opening, the leak detecting system comprising:

- a leak detector including

- a liquid retaining portion including a space configured to retain liquid flown into the leak detector, the liquid flown being a part of the liquid in the tank;

a flow path portion through which the space communicates with an interior of the tank and through which the liquid flows in and out;

a flow path opening/closing unit configured to open and close at least one end of the flow path portion;

a flow-rate measuring unit configured to measure an amount of the liquid flowing inside the flow path portion; and

a calibrating unit configured to calibrate the flow-rate measuring unit; and

a controller configured to control the leak detector, wherein

the leak detector is arranged inside the tank in such a manner that a first end of the leak detector is detachably attached to the bottom plate and a second end of the leak detector is supported in the through opening in such a manner that the leak detector is movable in a direction substantially perpendicular to a surface of the liquid.
